

Planet Dojo

Level

Beginners / Intermediate: Kids who know basic HTML

Time

30 to 50 minutes

Challenge

Create a web page that uses CSS to code its layout and design.

Introduction

Cascading Style Sheets (CSS) are used for describing the look and formatting of a document written in html. CSS is designed to separate the document content (written in HTML) from things like the layout, colours, and fonts. A single CSS file can be used to apply the same formatting to a number of different html pages.

If you create a style sheet called styles.css you access it from your html page by placing a reference in your Head Tags like this.

```
<head>
<link href="styles.css" rel="stylesheet" type="text/css" />
</head>
```

Aims

To be able to setup a CSS file and reference it from your HTML page
